# LASER PROBES

# A Full Portfolio Perfected Over Time

Nearly two decades ago, Synergetics introduced our first laser probe. Over the years, our R&D team has worked to continually improve our sophisticated designs to stay at the forefront of vitreoretinal technology. As surgery continues to become more complicated, it is our goal to continue to find new, innovative and effective solutions for the unique challenges often encountered in the modern practice.

Now, as Bausch + Lomb Retina, our comprehensive portfolio of surgical instrumentation is highlighted by our wide selection of laser probes, many of which feature the new technologies we have developed over the years. We offer 27ga tip options on select instruments, and our Illuminated Directional series of laser probes gives you the ability to effectively reach the periphery of the eye and perform scleral depressions on your own.

After almost 20 years, our full line of laser probes reflects the tireless work that we put towards finding new solutions for your unique surgical needs. It is this dedication to innovation that makes us an ideal partner for you.

LASER PROBE Instrumentation
